

BUSINESS REQUIREMENTS DOCUMENT

Project Name	Global Gift Budgeter	Document Version	1.2.0
Project Sponsor	Mishal Rai	Target Audience	Engineering Interns
Duration	6-Day Sprint	Status	APPROVED FOR SPRINT

1. EXECUTIVE SUMMARY & OBJECTIVE

The Context: For migrant workers and frequent travelers, buying thoughtful gifts for family back home requires constant mental math to account for fluctuating exchange rates and unfamiliar currencies.

The Business Objective: Create a targeted, stress-free currency converter. Users will build a "Wishlist" of items they want to buy, inputting the price in the foreign currency. The system will then instantly calculate and display the total budget required in their native home currency.

The Engineering Objective: This project trains you in **Data Transformation and API Math Engine design**. You will learn how to design a relational database that links static items (gifts) with dynamic variables (daily exchange rates). Furthermore, you will use Linux Bash scripting to simulate automated daily updates to those exchange rates, mimicking how real fintech apps poll for live market data.

2. RECOMMENDED TECHNOLOGY STACK

- **Frontend:** JavaScript (Vanilla, React, Vue, etc.), HTML5, CSS3.
- **Backend:** Python 3.x (Flask, FastAPI, or similar).
- **Database:** MySQL 8.0.
- **Automation:** Native Linux Bash shell scripting.

3. FUNCTIONAL REQUIREMENTS

- System allows users to add/delete items from a 'Wishlist' storing foreign price.
- API calculates conversion dynamically using an Exchange Rate table.

4. DATA FLOW ARCHITECTURE

5. 6-DAY SPRINT ROADMAP

Day	Phase & Deliverable
Day 1	MySQL Schema & Database creation.
Day 2	Python Core Logic.
Day 3	API Development.
Day 4	Frontend UI Build.
Day 5	Bash Automation Script.
Day 6	QA & Handover.
